March Joke Contest Finals

Note: Only 7 students submitted jokes for this contest!

A fast food drive-through has 2 operators. Customers arrive at the drive-through according to a Poisson process with parameter lambda. Fast food workers spontaneously care about customer service for infinitesimally short periods of time according to a Poisson process with parameter 1/10000000. What are the chances that any fast food customer receives good service ever? (Hint: simultaneous events have probability 0...)

Mrs. Wierman: Why are you home so late? All I asked was for you to pick up a few things from the supermarket.
Professor Wierman: Well, customers were arriving to the store according to a Poisson Process, and then I experienced the memoryless property.

What do you call a Giant store being devastated by a strong wind?
A mart in gale
