

Idea

Building a **scalable, accessible** tool that enables visualization, retrieval, and **comparative analysis** of petabyte-scale neuroscience data and annotations

Objectives

- Facilitate research in **connectomics** (mapping neural connectivity) to accelerate advancements in **health and computation**
- Establish a **novel, open tool** for use in neuroscience research
- Democratize access** to publicly-available neuroimaging data

Opportunity & Challenge

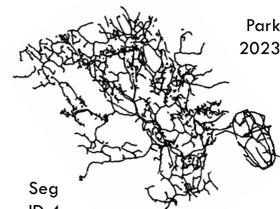

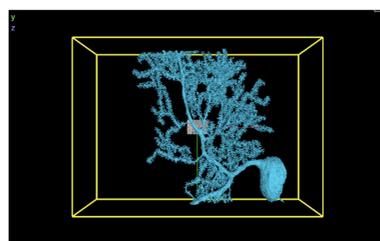

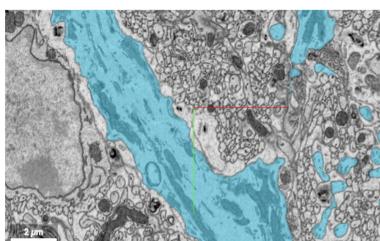

- There exists a **demand** to provide the community with an atlas illustrating datasets available across the brain by species
- Current datasets exist in **isolation** with little information about relative spatial location, which makes comparison difficult
- The issue is significant with available data **growing in scale** [1]

Impact & Future Directions

- With burgeoning information, it is imperative that scientists have **integrated access points** for comparative connectomics
- As algorithms are developed to “snap” imaging volumes onto reference models, a visual atlas will allow for **co-registration**
- Secondary analysis** of overlapping studies will help quantify the extent of individual variation in brain connectivity, reveal patterns that underly cognition, behavior, and disease, and inform neural networks

Case Study

- C-MAP enabled the identification of three datasets from the mouse cerebellum; we propose a case study on neuron development through an analysis of Purkinje Cells in this region
- Pipeline: Segmentation → Neuron meshes → Skeletons → Statistics

C-MAP Home About Atlas

Now viewing:

Cerebellum (3)

[Clear selection](#)

Nguyen, Thomas et al. 2022

A large-scale transmission electron microscopy dataset of an adult mouse cerebellum

Park et al. 2023

Serial blockface scanning electron microscopy, segmentation and meshes of reconstructed neurons within the mouse cerebellum

Wilson et al. 2019

High-resolution electron microscope image volumes from mouse cerebellum at different ages in early postnatal development

Neuroscience made for everyone

Our vision (home page)

Components of the C-MAP Atlas

C-MAP is publicly available at <https://atlas.labs.bossdb.org/>
Example user flow: launch project → view atlas → browse cerebellum datasets

three.js

Viewing: Mouse Brain Model

Grid scale: 1 box = 300 μm

Brain Model

Cerebrum	0.2
Hippocampus	0.2
Somatosensory	0.2
Visual Cortex	0.2
Brainstem	0.2
Thalamus	0.2
Cerebellum	0.4

View Controls

Close Controls

Key for indicators

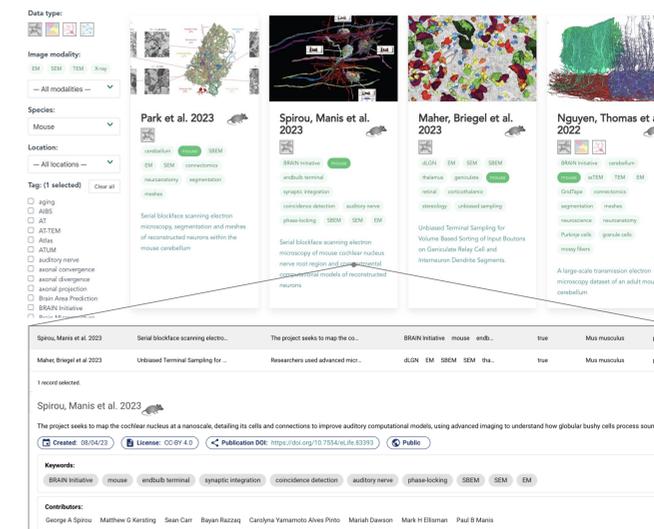

● = location known or centered

● = hemisphere unknown; right possibility

● = hemisphere unknown; left possibility

Results

- Built Connectomics Multimodal Atlas Project (C-MAP), a web-based tool for visualizing data using mice as a model organism
- Mapped 25+ studies to brain regions from **standard reference**
- Used Three.JS to create **interactive 3D web-based graphics** as a basis for the atlas
- Developed GUI to **interface with model**, set up improved view, and further accessibility
- Created functions to **retrieve necessary BossDB metadata** to continuously and asynchronously update visual indicators with project descriptors
- Data sources** include BossDB [1], an APL-developed platform that stores peta-scale information, and the Allen Institute’s Brain Atlas [2], a standard neuroanatomical model

Snapshot of four recent mouse datasets ([bossdb.org](https://atlas.labs.bossdb.org/)) and associated metadata ([metadata.bossdb.org](https://atlas.labs.bossdb.org/metadata)) for example project
